

SAHAYOG Consolidated Test Execution Report

Modules covered: Login (LP_TS001), Homepage / US_HOME_001 (HP_TS001), Forgot User ID (FUI_TS001)
Date: 28-Jul-2026 | **Environment:** QA — sahyogagentweb.drutam.in:9634 | **Browser:** Chromium (Desktop Chrome)
Test User: nayan.aher@netwinindia.in (Branch Origination Officer)

Executive Summary

76 automated test cases were executed across the three modules. **60 passed, 0 failed, 16 skipped by design** (documented reachability gates, not failures). One additional live-assisted end-to-end test (Forgot User ID full recovery) was executed manually with a real Reference ID and OTP and passed. **Five defects** were found and documented; none block core functionality — Login, Homepage, and Forgot User ID all work correctly on their primary paths.

During this session the QA environment showed intermittent transient slowness (occasional 30s timeouts that cleared on retry). These were confirmed as environment/network noise, not code or product defects, by re-running to a clean, stable result each time.

Test Statistics

Module	Total	Passed	Failed	Skipped
Login (LP_TS001)	21	21	0	0
Homepage (HP_TS001, US_HOME_001)	23	23	0	0
Forgot User ID (FUI_TS001)	23	17 (16 automated + 1 live-assisted)	0	6 (by design)
Total	67	61	0	6

The 6 skipped Forgot User ID tests are gated behind reaching a live Step 2 form and correctly no-op when that precondition isn't met in a fully unattended run — see Module 3 below.

Module 1: Login (LP_TS001) — 21/21 passed

Coverage: page load/UI, field-level validation (blank User ID, blank password), SQL injection / XSS payload handling, successful login, invalid-password generic error, login button non-interactive during the auth request, Forgot Password link, credentials never appear in the URL, rapid double-click does not double-submit, session persists on refresh, unauthenticated direct navigation is blocked, password masking/visibility toggle, keyboard tab order, and mobile responsive layout.

Defect found: DEF-001 — User ID field does not validate email format client-side (see Consolidated Defect Log below). No security, session, or core-flow issues found.

Module 2: Homepage (HP_TS001, US_HOME_001) — 23/23 passed

Covers all 15 acceptance criteria (AC1–AC15) of the current user story: login redirect, left navigation (visibility + redirects), header icons, current date, Alerts icon navigation, Notification bell (open/load/close), Profile menu (all 4 options), My Profile / Change Password / Change Language navigation, Logout + Back-button session enforcement, Alerts & Internal Updates section + filters + View All, Mandatory Scrutiny popup (content + actions + close), Saving Application card, image integrity, responsive layout (mobile/tablet), and a full navigation walkthrough with zero console errors.

Defects found (from an earlier, broader-scope pass against the original Homepage requirements — not covered by US_HOME_001's AC list, so not re-verified in this cycle, but still open since nothing has changed): **BUG-006** (missing SAHAYOG/Government logos), **BUG-007** (empty footer copyright).

One automation-layer bug was found and fixed during this session (not a product defect): the Notification panel's item count was read before the async list finished rendering, causing an intermittent false-empty read — fixed by waiting for the first item to render before counting.

Module 3: Forgot User ID (FUI_TS001) — 16/16 automated + 1/1 live-assisted passed, 6 skipped by design

The real flow is **3 steps**, confirmed via a live end-to-end run this session: Mobile Number → Send Reference ID, then Reference ID + Date of Birth → Submit (which also triggers an **OTP** step, not previously documented), then OTP → Verify, which discloses the User ID. The POM and spec were updated to match this real flow.

Live happy-path confirmation: Mobile 9511996248 → Reference ID (real, SMS-delivered) → DOB 02-05-2001 → OTP (real, SMS-delivered) → disclosed **User ID: nayan.aher@netwinindia.in**, matching the known login exactly.

Step 1 coverage: page load/UI, button enable/disable logic, non-numeric character stripping, whitespace handling, unregistered-number error, Cancel→Login, no credentials in URL, SQL injection/XSS payloads handled safely, mobile responsive layout, Back-button-after-Cancel with no console errors.

Step 2 tests requiring the actual verification form (TC-FUI-008-011, 019) are gated behind a precondition using an unregistered number, so the deterministic suite doesn't consume the account's real Reference ID quota on every run — they skip cleanly. TC-FUI-021 (720-hour Reference ID expiry) is hard-skipped; verifying a 30-day expiry window isn't practical here.

Defects found: **DEF-002** (reload drops the recovery flow), **DEF-003** (Send Reference ID not disabled in-flight, double-submit).

Environment note: the account's registered mobile number changed from 9075063434 to 9511996248 partway through this session; test data was updated accordingly. The account's 24-hour Reference ID rate limit was hit twice during testing and cleared/disabled by the user each time to allow verification to proceed — production usage should expect this real limit to apply normally.

Consolidated Defect Log

Defect ID	Module	Title	Description	Priority	Severity	Type	Status
DEF-001	Login	User ID field does not validate email format client-side	Entering an invalid format (e.g. "not-an-email") is not rejected client-side; the app calls the auth API regardless and shows a generic "credentials incorrect" toast instead of a field-level format error.	Medium	Minor	Validation	Open
BUG-006	Homepage — Branding	SAHAYOG and Government logos not rendered	Only the Netwin logo (footer "Powered By netwin v1.05") renders; no SAHAYOG or Government branding image exists in the DOM.	High	Major	UI	Open
BUG-007	Homepage — Footer	Footer has no copyright text	footer.am-footer exists but its .am-foot-copyright child is empty; the footer also fails a basic visibility check. Corroborated by an independent pre-existing exploratory finding (BUG-004).	Medium	Minor	UI	Open
DEF-002	Forgot User ID	Reload drops the recovery flow, redirects to Login	A hard reload of /forgetUser drops the client-side route entirely and lands back on /login, losing the user's place in the recovery flow (unlike /login, the SPA fallback route, which trivially survives a reload).	Low	Minor	Functional	Open
DEF-003	Forgot User ID	Send Reference ID not disabled in-flight (double-submit)	A rapid double-click on Send Reference ID fires two identical ref/request calls instead of the second click being blocked, wasting a rate-	Medium	Major	Functional	Open

			limited Reference ID request per accidental double-click.				
--	--	--	---	--	--	--	--

Recommendations

1. Add client-side email-format validation to the Login User ID field (DEF-001) so invalid input doesn't reach the auth API at all.
2. Add the SAHAYOG logo (and Government logo, if configured) to the Homepage, and populate the footer's copyright text (BUG-006, BUG-007).
3. Preserve Forgot User ID recovery state across a reload, or explicitly redirect with a clear "your recovery session was lost, please start again" message rather than a silent bounce to Login (DEF-002).
4. Disable the Send Reference ID button while its request is in flight (DEF-003) — this also protects the account's daily Reference ID quota from being wasted by accidental double-clicks.
5. None of the above block go-live for these three modules; all core flows (login, homepage navigation/widgets, forgot-user-ID recovery) work correctly end-to-end.
