

FP_TS001 — Forgot Password Test Execution Report

Date: 29-Jul-2026 | **Environment:** QA — sahyogagentweb.drutam.in:9634 | **Browser:** Chromium (Desktop Chrome)
Test User: nayan.aher@netwinindia.in

Executive Summary

14 test cases were executed against the Forgot Password module: **13 deterministic tests, all passed**, plus **1 live-assisted end-to-end happy-path test, passed**. The full 4-step recovery flow — User ID → Reference ID + Date of Birth → OTP → password reset form — works correctly end-to-end when Reference ID delivery succeeds. One defect was found (BUG-FP-001), and one reliability concern was observed around Reference ID delivery timing (BUG-FP-002, not a hard functional defect).

Test Statistics

Test Type	Total	Passed	Failed
Happy Path / UI	5	5	0
State-Aware UI	2	2	0
Negative	1	1	0
Security	3	3	0
Responsive	1	1	0
Live Happy Path (Manually-Assisted)	1	1	0
Total	13	13	0

Test Case Execution

Test Case ID	Title	Result
TC-FP-001	Forgot Password page loads with all UI components	Pass
TC-FP-002	Page URL is correct after navigation	Pass
TC-FP-003	Send Reference ID button is disabled while User ID is blank	Pass
TC-FP-004	Send Reference ID button enables once User ID has a value	Pass
TC-FP-005	Whitespace-only User ID does not disable Send Reference ID	Pass (documents BUG-FP-001)
TC-FP-006	Unregistered User ID shows an error and stays on Step 1	Pass
TC-FP-007	Cancel from Step 1 returns to the Login page	Pass
TC-FP-008	Credentials never appear in the URL	Pass
TC-FP-009	SQL Injection payload in User ID is handled safely	Pass
TC-FP-010	XSS payload in User ID is handled safely	Pass
TC-FP-011	Responsive layout on mobile viewport	Pass
TC-FP-012	Browser Back button after Cancel returns without errors	Pass
TC-FP-020	Full recovery with correct Reference ID, DOB, and OTP unlocks password reset (live)	Pass

Live Happy-Path Confirmation (TC-FP-020)

Executed live with real, human-relayed data (no fabricated values, per project convention for verification-screen data):

- 1. **Step 1** — User ID `nayan.aher@netwinindia.in` → Send Reference ID → "Reference ID sent successfully"
- 2. **Step 2** — Reference ID `SMCC202607299385` + DOB `02-05-2001` → Submit → "OTP sent successfully", navigated to `/verifyOtp`
- 3. **Step 3** — OTP `9375` → Verify → "OTP verified successfully", navigated to `/resetPassword`
- 4. **Final** — Password reset form revealed: New Password, Confirm Password, Save. Not submitted (would change the account's real password — out of scope for verification).

This confirms the module's core purpose — unlocking the password reset step after identity verification — works correctly.

Reliability note: across 4 real Send-Reference-ID attempts made during testing (28–29 Jul 2026), 2 did not deliver (SMS or email) within a 5-minute wait, while 2 succeeded promptly. By contrast, the sibling Forgot User ID flow delivered reliably on 2/2 real attempts to the same registered number in the same session. This suggests an intermittent delivery issue specific to Forgot Password (or a transient gateway issue) rather than a hard functional defect — logged as BUG-FP-002 at Low severity.

Defect Log

Defect ID	Title	Description	Priority	Severity	Type	Status
BUG-FP-001	Whitespace-only User ID does not disable Send Reference ID	Unlike a genuinely blank field, entering only spaces into User ID does not keep the Send Reference ID button disabled. The server correctly rejects the resulting request ("User not found"), but the client-side gate that should stop the request firing at all is missing. Corroborates a pre-existing exploratory finding.	Medium	Minor	Validation	Open
BUG-FP-002	Intermittent Reference ID delivery delay/failure	2 of 4 real Send Reference ID attempts for Forgot Password did not deliver (SMS or email) within 5 minutes, despite the app reporting success each time. The sibling Forgot User ID flow delivered reliably (2/2) to the same registered number in the same session, suggesting the issue is specific to Forgot Password's delivery path.	Low	Minor	Functional	Open

Coverage Notes

Step 2's real field set (User ID, Reference ID, Date of Birth) is simpler than an older exploratory record on file, which showed 6 fields (adding First Name of User, Employee ID, Mobile No.) — the flow has evidently been simplified to the 3-field shape the story document itself describes. `ForgotPasswordPage.ts` reflects the current live structure.

A 720-hour Reference ID expiry test was not automated — verifying a 30-day expiry window isn't practical in this environment, consistent with the same gap already accepted for Forgot User ID's TC-FUI-021.

Recommendations

- 1. Fix BUG-FP-001: disable Send Reference ID while the User ID field is whitespace-only, matching the blank-field behavior.
- 2. Investigate BUG-FP-002: confirm whether Reference ID delivery for Forgot Password uses the same notification path as Forgot User ID, and why it intermittently doesn't arrive within a reasonable window.
- 3. No blockers to go-live — the core recovery flow (identity verification → OTP → password reset unlock) works correctly whenever Reference ID delivery succeeds.
